---

In the tree control reference example there is this code

```
void LoadTree(int parent, const String& path, Progress& pi)
{
    pi.SetText(DeFormat(path));
    for(FindFile ff(AppendFileName(path, ".*")); ff; ff.Next()) {
        if(pi.StepCanceled())
            return;
        String n = ff.GetName();
        if(n != "." && n != "..") {
            edit.Add();
            edit.Top() <<= n;
        }
    }
}
```

Why does the last line use operator<<= instead of operator= ?

If there's no reason then it should be changed to operator= because it took me a while to track down the fact that it seems to go through Ctrl::operator<<= which goes through the SetData virtual function into EditField::SetData. For a newcomer or even not for a newcomer, it's not easy to find what that operator<<= does - it doesn't make any sense to use it in an example.

Also, why does the above code do an unnecessary call to the Top() function - couldn't it just be edit.Add() = n;

And lastly (off topic but related to the edit.Add function call), does U++ assume that memory allocation with new never fails - how does U++ handle failure?

Graeme
