Naturally it just works. Sigh In my defense, sourceforge was down most of my morning, so no easy access, and Auto Assist cores too much in my NetBSD port so I turn it off

Some caveats that got me were that HideTab() index refers to the visible tabs, ie, without whatever AddIndex() I also have. As it should of course, just didn't occur to me immediately.

Secondary, there seems to be a bug with horizontal scrollbar. It turns on before my tabs are even close to the right-side edge. Almost like it is adding up all tabs, including those Hidden, to work out when to enable the horizontal scrollbar.

I can live with that for now.

That takes care of that TODO. Only the "let users chose the order of name,size,date,user,group,perms" in ArrayCtrl, but that feels like a lot of work

Cheers
