I searched but could not find an answer, I may just be missing something.

When the file choosing window is opened and without picking a file when the "Cancel" or red "X" is clicked to close the file chooser it opens a file. How can this window be closed without opening a file?

```
fn <<= Nvl(r_d, recent_dir);
if(fn.ExecuteOpen()){ // file chooser
  Data<<=Value(fn);
  r_d = fn;
  recent_dir = ~fn;
}
```

Neil
