Thanks Novo, it looks quite interesting.

Especially the assembler library caught my attention. It replaces some common c functions (mem{cpy,move,set},str{cat,copy,len,cmp}) with assembler versions using advanced instruction sets. Out of curiosity I launched a benchmark code from the NTL/STL comparison page. But to my great disappointment, it turns out there was no recognizable gain in speed. If there is someone interested enough to try to figure out why, I would be very interested.

But anyway, the manuals look good.

Best regards,
Honza
