Urr is quite nice in terms of interface..

a quick feature request comes up in my case.

using UrrServer, i'd need the adress of the client, the packet came from..

is this possible for you to make available in Urr?

I have no problem adding this feature by you, this is bazaar after all

However, I have to warn you about USING it for anything else than small projects in controlled environment. Too many devices in networks are performing NAT, so client address tends to be completely unreliable.
