Quote:I am afraid you will need a new callback introduced to RichEdit, something like "WhenStyleUpdate"?

This will be a good idea! I am thinking to use "WhenRefreshBar" or "WhenAction", both available, but maybe this way will be an work overload.

Around QTF now I have, (hope last) again another problem: there is not included way for force page breaks. I don't understand very well how U++ Report work and how it divide the pages. I need to insert in the QTF source more data, synchronized with the pages, before to passing it to the report. Just for example: before to the end of the page, I want to add a new paragrah, that must to be la part for every page, without use footer, that is for static text. For undertand can imagine an bom list where, before the page finish, will be inserted some resumes of the page.

In fact I just want do insert, for every page, some static header and footer, synchronized with pages, without using the report Header and Footer.

Any idea ?

(hope for me that this will be last problem around QTF).
