Subject: TabBar crash fix (very crude one, needs author to rewrite it)

2 fixes included:

1) "Value v = tabs[`cross`].key;" does crash when `cross` is outdated (easy to achieve by clicking with mouse on close inactive tabs without movement and fast enough ... active tab will reset `cross` to -1, so if last tab is active one, no crash occurs)

2) `Close(...)` should be IMO called *after* registered callbacks
