Subject: TabBar crash fix (very crude one, needs author to rewrite it)

2 fixes included:
1) "Value v = tabs[cross].key;" does crash when cross is outdated (easy to achieve by clicking
with mouse on close inactive tabs without movement and fast enough ... active tab will reset cross
to -1, so if last tab is active one, no crash occurs)

2) Close(...) should be IMO called *after* registered callbacks
