Quote:

Not sure if I understand the question correctly, but if yes, then the answer is the:

We already did. It was always this way in U++...

(There is an exception, "DHCtrl", but that is only because some APIs require native widget windows, e.g. OpenGL).

Mirek

sorry for not being clear. I should have used the words "totally get rid off". Because popups and menus are created from the system windows, aren't they?

/* related off topic

And they killing my time currently because they are not displayed on osx11 and I can't use thelde and I need to find where the bug is somewhere around in X11Wnd.cpp

```
void Ctrl::WndShow0(bool b)
```

```
....
```

```
  XMapWindow()
```

```
...
```

```
*/
```

if the whole window is an image or series of images (or their references) then it would open a possibility to stream thelde and upp apps to a remote terminal?
