Not sure if I understand the question correctly, but if yes, then the answer is the:

We already did. It was always this way in U++...

(There is an exception, "DHCtrl", but that is only because some APIs require native widget windows, e.g. OpenGL).

Mirek

sorry for not being clear. I should have used the words "totally get rid off". Because popups and menus are created from the system windows, aren't they?

But you cannot do it otherwise.

At some point, you need a host platform window to make your drawing in it...

Quote:

if the whole window is an image or series of images (or their references) then it would open a possibility to stream the data and upload apps to a remote terminal?

Sure.
