thanks for the explanation. I'm still thinking in terms of tcl/tk

I coded my first program with upp. It has a button to load image and display it as in the examples posted in this forum in label. And it works. Now I need to adjust the placings.

One thing still is unclear: how to copy data to Image-class. I tried to look at the code, but it says nothing to me. And make the label scrollable.

thanks
-matti
