I thought about one label for cell and set the font courier. But your idea seems better because I can format each of them in different manner (style and color)... yes, good idea
This time the composite widget should not be a problem because I do not need to retrieve data. But I am afraid of the array cursor that could be not aware that I clicked on the label.
Ok, I'll do some experiment... but gime ve time and I'll post a test case.
BTW, is there a label that can be formatted in QTF? I couldn't found it. Perhaps should be easy to do it spying in the code of some Prompt method in which the QTF string can be set.
