That looks great

One hint: I believe that for the quoted style includes, only files from current package should be suggested. IIRC the gcc search for the file relatively to the current file, so if the other package was in different assembly, it might cause problem. Also it is IMHO a good coding style to use `#include "file.h"` only for "local" files.

Have you tested how the CoWork solution works on single core processor? (Or when you set affinity of the process to single core...).

Unfortunately, I can't answer the question about ArrayCtrl, as I don't know answer...

Looking forward to see the code

Honza
