what about redirecting printf's as well? meaning stdout and stderr?

i've looked at how it's done, it's not hard in terms of code, but not easy in terms of handling. redirecting is done to a pipe, but the pipe can be full, because not fast enough reading from it and posting to, let's say to the console window, so the printf blocks.

this also would make it impossible to be properly 'inlined' in chronological manner with RLOGs.., since it's buffered with both pipe and the Stream writing to Std Log Stream..

any ideas / comments anyway?
