koldo wrote on Fri, 25 February 2011 06:43Hello all

I wanted to select all registers from columns Name, Surname and Location that contains either text1 or text2.

For example, if the table is:
Name Surname Location

Mary Poppins Bruxelles
with text1 = "pin" and text2 = "elle", the second register would be selected.

How could it be done?

 http://www.postgresql.org/docs/8.3/static/functions-matching .html

I guess it is even SQL standard.

In SqlExp, use Like.
