It's always the trivial things I have to ask for

What is the deal with Format and NFormat. I have not really found any documentation giving details to its use. But looking at sources, it seems %` (percent-backtick) prints date/time, but always in US order. No help for SetDateFormat, and only t.cpp has an example that does not change the format (when used with %`).

%5.2g and %5.2f give me asserts. The docs seem to favour %n instead, and sometimes %5.2n works, but with more than 2 digits in the decimal place, sometimes asserts. %5n seems to work ok, just not the way I was hoping.

What is the difference between NFormat and Format? The examples seem to use both.
