Subject: Use unique output directory per assembly (append assembly name to output director)

I have made a subtle change in theide building process:

Output directory now appends a name of assembly. It means that each assembly now has unique set of output files (like .obj or .lib). Quite often, this will lead to unnecessarry duplication, and it is also true that the same thing could have been achieved before by specifying different out directory.

Whatever, this is still a little bit better when frequently working with branches.

Whole thing is optional and can be switched off in Setup/Environment.
