Quote:

%` is "empty" - default format. In fact, ` can be used as delimiter of format code; the trouble is that unlike classic printf, Format allows you to define your own formats with id's, means you sometimes need delimiter to tell apart id and text..

Yeah I suspected as much reading Format.cpp, but alas, without Documentation, or examples, of how to use that code...

If troubles persist, send the code!

Only example I found was

uppsrc/Core/t.cpp: SetDateFormat(t_("date-format\a%2:02d/%3:02d/%1:4d"));

and not having any specs on it, I swapped %2 with %3 thinking that would do it, but it did not.
