silverx wrote on Fri, 25 March 2011 23:05I created a new package, as empty. How do I start a item to put code in?

Like if I want to do x.h, or x.cpp, how do I start that so I can start doing the code?

Also if I open an item that has code, how do I add new code, such as if I want to do an include for something that I write? example the x.h or y.cpp?

How is this possible?

File > Insert package directory file. The same menu is also available when you right click in the bottom left area, where the file list usually is. In the file selector that appears when you click it, you can either open existing file, or just type a name of a new one and it will be created.
