Hello All,

I propose to integrate Google Chrome (Chromium) browser in U++.

The idea is: U++ application process will run the original Chrome browser process and communicate via IPC (Inter Process Communication).

Let look to Google process architecture:

I hope we need to integrate in U++ only Browser process functionality and wrap RenderViewHost. Render processes will be original Chrome executable(s).

What is good:

  Cross-OS browser in U++;
  The U++ application file size will be less than all Chrome functionality;
  The hard work of the browser will be in separate process - render (Google chrome or Chromium);
  The compile time and hardware requirements for compile will be less (not minim 4 gb of RAM);
  The stability will not be lost in case of browser crash;
  Can control render processes and turn off the unanswerable processes.

But can be some problems:

 Version compatibility

The original idea was posted here

What we need to test:

 If is possible to integrate browser functionality in U++ and wrap only the "RenderViewHost".
 If is possible to get Chrome version and other details via IPC.

Any advice are welcome!
