If they do, we can make it "#define LOG(X) {int i=0;}", so later they can start warning us about "useless code block" Then I would really start to consider using -Wno-empty-body (or -Wno-useless-code).

Honza

This one would yield "unused variable" even today...

I guess the one possible way around would be:

inline void Nop() {}

#define LOG(x) Nop()
