Well there are plenty examples on using python but when it comes to embedding python there is almost but no quality information available. my current boost py test package is evolving slowly. but I am on the way. often problems arise around ownership issues since most info leaves it to python but when it comes to exposing existing up instances almost no examples.

So far my biggest concern is to choose the right up representation for the python data types. which is ready for the trivial types but cumbersome for the containers. see my boost python thread

Thanks
