Subject: Simpler way to access Option in GridCtrl

Hello Daniel

Option() method is very nice but it is not possible to get access to the underlying control (for example to set a WhenAction()).

To get that possibility when adding a row I have to do this:

```
while(SQL.Fetch()) {      // Loop for all fetched data
 grid.Add();      // Added new row
 for (int i = 0; i < fields.GetCount(); ++i) {  // For all fields
  sqlBase.grid(i) = SQL[i];   // Filling with data
  if (column is Option) {    // THIS HAVE TO BE DONE FOR ALL ROWS
   Option *opt = new Option();  // new Option()
   opt->WhenAction = THISBACK(MyCallback); // Set the callback to the control
   sqlBase.grid.SetCtrl(i, opt);   // Set the control to the cell
  }
 }
}
```

Is there any simpler possibility?
