```
hi
```

a DropList with such entries

```
dl.Add(100, "Apple");
dl.Add(100, "Cherry");
dl.Add(101, "Pear");
dl.Add(100, "Berry");
```

will always show 'Apple' even if Cherry or Berry are selected. it's due to Sync() method which key.Find()'s the value of the first entry only..(typical Map/Index behaviour).

it'd be great to be able to select the entries independantly, even if they got the same key..

is that possible somehow?
