a DropDownList with such entries

```
dl.Add(100, "Apple");  
dl.Add(100, "Cherry");  
dl.Add(101, "Pear");  
dl.Add(100, "Berry");
```

will always show 'Apple' even if Cherry or Berry are selected.

it's due to Sync() method which key.Find()'s the value of the first entry only..(typical Map/Index behaviour).

it'd be great to be able to select the entries independantly, even if they got the same key..

is that possible somehow?

Its a feature. In fact, correct solution would be ASSERT that ensures that the key is unique.

The value of DropDownList is defined by key. Value is just for display reason.
