OK, here is what I am going to do:

1. On Windows(Linux), run our test program to enumerate fonts. Filter out non-chinese fonts.

2. Transalate to octet escaped version for font names when necessary

3. Create an entry for each of the font name, with the most favorate 4 fonts (serif/sans serfi on win/lin) listed on top of all chinese font entries.

4. Post the result to this thread.

If you have a better plan, please let me know. Thanks!
