OK, here is what I am going to do:

- 1. On Windows(Linux), run our test program to enumerate fonts. Filter out non-chinese fonts.
- 2. Transalate to octet escaped version for font names when necessary
- 3. Create an entry for each of the font name, with the most favorate 4 fonts (serif/sans serfi on win/lin) listed on top of all chinese font entries.
- 4. Post the result to this thread.

If you have a better plan, please let me know. Thanks!
