Hi,

At least since 3409 (under Ubuntu 10.04), the code completion (using the Assist++ window that appears after typing . or ->, and clicking on the desired method or variable) is no more working. A popup with "Invalid memory access" appears, and Theide dies...

I've still the problem with 3412. Sorry, no time for now to download and test last nightly build : forget this if solved in a more recent version...

A problem with code completion was mentioned in this post, but seems to be different : I always get the assist++ popup.
