Thanks again for the code example.

I could add that bar to show all the layers that are enabled.

This is what I use to show the last layer picked.
In Java I renamed the "Distance" label to "Layer" for that text field and when calculating a geodesic distance it would change back to "Distance".
I think I tried a Upp app that does this but have not implemented it in this one yet.

What your code shows is what I tried for a "Help" sub menu, until my head hurt. Now I should be able to do it.

A question on that is can I pull up a text file into that new window?
