running the Python code in a Upp app would save a lot of time

well thats exactly the point of embedding python. in this case, in an upp application.

to have a scripting support at hand when needed is a huge advantage, especially when debugging. and also, when defining gui layout, this could be worth using.

i actually see py2exe in a different use case, where one only has got a py script, and wants to be independant from py installation.

but the currently addressed use case deals with interoperability of U++ and python, where precompilation does not make sense. that for the case where the user wants to have the possibility to run some sort of own task inside the prepared environment, let's say an automated test for a device..
