You can "avoid" qtf by calling DeQtf for texts you pass... That will add escape characters that will "quote" original text in Qtf.

```
void  VegaTab4::PrintCB()
{  Report r;
// r.Header("[A2> Page $$P");
 r << "Round 1";
   r <<
DeQtf("===========================================================");
   r << DeQtf("  1 =   4 Karpov, Igor        -  2 Karpov, Vadim      = 1 - 0");
   r << DeQtf("-----------------------------------------------------------------");
   Print( r, 1, "Preview");
// Perform(r); //same format error
}
```

Mirek
I tried and it works. Unfortunatly there is again one more problem   : by default it is set the proportional font. Instead i would like to print with courier font to preserve the vertical alignment present in the file. Using UWord I got the format command to print with courier, say 11. So I've tried to embed one
Quote:

What about reading QTF reference instead?

http://upp.sourceforge.net/srcdoc$RichText$QTF$en-us.html

 text line in a formatted command line with courier font like this:

```
void  VegaTab4::PrintCB()
{  Report r;
   r << "[ $$0,0#00000000000000000000000000000000:Default]"
      "[{_}%EN-US"
      "[s0;C+92 Round 1 ]";  //it's OK

   r << "[s0;C+92 " << DeQtf("Round 1") << " ]";  // doesn't work
   r << "[s0;C+92 " <<
DeQtf("===================================================") <<" ]" ;
   Print( r, 1, "Preview");
}
```
This produce problem (see attached picture) because do not recognise the final "]" and this

seems strange to me.

I've even tried
    r.SetFont(Courier(12));
with no success. So, is there a way to set by default the Courier font?

Luigi

There is one tricky thing about Report::operator<< - it takes each call as separate qtf text. So

r << "[s0;C+92 " << DeQtf("Round 1") << "]";

makes for 3 separate texts.

To fix it, simply add texts together:

r << "[s0;C+92 " + DeQtf("Round 1") + "]";

(Note that adding here is possible becase DeQtf returns String).
