Subject: ColorPopup widget crashes TheIDE with "Invaild memory Access" on latest Daily builds of U+

Hello guys,

There seems to be a crucial bug in Colorpopup.cpp which crashes any application, including TheIDE itself, using ColorPopup widget due to an "invalid memory access". Tested on both Ubuntu + Kubuntu 11.04

Crash can be reproduced while changing Syntax highlighting colors through Setup/Environment/Syntax Highlighting/Color buttons

Crash occures when SetFocus() method is invoked in CtrlLib/ColorPopup.cpp, line 317:

```
popup->SetRect(rt);
if(!popup->IsOpen())
 popup->PopUp(owner, true, true, true);
SetFocus(); // ********** Crashes any application using Colorpopup
```

I didn't have the time to examine the source code further, but shouldn't it be popup->SetFocus() ?

Regards.
