I've found more logical and convienent assignment of:
1. "Go to symbol definition" to ALT_[,] which also has < sign.
That associates better with "go back" (*.h file)
2. "Go to definition/declaration" to ALT_[.] which also has > sign.
That associates better with "go forward" (*.cpp file) and it's more convienent to navigate like an alternative combination to Ctrl_[.]

And both these keys are more visually distinguishable and closer to arrow keys which you have to use in case you jumped into the wrong place...
