I tried it first as the package with everything in it, and while it does compile and link when it executes I get the error message about the entry point can't be found.

Then I tried to do just the simple function that I want out of all of all of the package, but got different errors about not finding the part that I was only wanted.

It would be nice if the main package was not getting the entry point error.

I will try some more on getting just the piece I want working though.
