Hello

This is a strange problem. Tojocky has made a test and this is the status.

- Tojocky (XP-SP3)-Silverx(Vista) compile and link the program, but when starting it they get a:
The procedure entry point K32GetModuleBaseNameW could not be located in the dynamic link library KERNEL32.dll
- I compile the program and runs well in two computers (both XP-SP3).
- I send this program to Tojocky and runs also well in his computer

I do not understand anything.
