This depends on what you want to do exactly :

- With telnet or ssh, you will have a command line, and you need just a telnet or ssh client to have the connexion to this command line, then you will act easily as if you were directly on the PC's command line, and run any application you want.
- With a web server and web app, you will have an app that can be used via http protocol (no more telnet or ssh) with a browser.

Seems that the web app is better in your case, but if you have to write it, it's probably easier to make a command-line app and run it via telnet or ssh...

For the web server, maybe you could use easyphp under Windows. But my advice should be to use Apache under Linux (ie Ubuntu or Debian) for reliability and security.
