Hard to tell what is the cause, when nobody can reproduce it... Could you try to compile theide in debug mode and run theide in debugger and post the backtrace when the crash happens?

Is there something unusual about your ubuntu setup? My guess is that there is something wrong with the PopUp code. Mirek was tweaking that recently, but IIRC it was after you first reported this, so there should be no direct connection...

Honza

Hi Honza,

Actually, I can reproduce this bug all the time on my kubuntu 11.04 setup with latest daily builds, and yes my suspicion is also that it is a bug deep in the popup code or x11 base (which, you might remember, I've already reported an issue about color popups). But unlike the color popup widget crash, I can avoid the code completion window crash by using keyboard instead of mouse click.

Regards.
