Hi all,

I have the exact same problem with the latest svn versions. I'm on fedora12 (not been updated since some time now) and everything worked fine before.

I also have the same problem with the color popup:
Ide crashes when in QTF assist or with Uword.

These two crashes are really annoying.

A third crash is with QTF assist : if you try to modify style or something like this: ide crashes .

I will try to use the keyboard instead of mouse to see if it doesn't crash.
