nneilson wrote on Tue, 31 May 2011 04:43 opendir just iterates through all files in a directory and sub directories.

There must be some function in Upp that does this. FindFile object is usually used for this, something like:

```
void IterateThroughDirs(const String& dir){  
    for(FindFile ff(AppendFileName(dir, "*")); ff; ff.Next()) {  
        if(ff.IsFolder())  
            IterateThroughDirs(ff.GetName()); // call itself on the subdirectory  
        else if(ff.IsFile()) {  
            // process the file ff.GetName() here  
        }  
    }  
}
```
