Hello Neil

Using Honza code and replacing this stuff:

```
if (sscanf(s.substr(0, 2).c_str(), "%x", &l) && sscanf(s.substr(2, 8).c_str(), "%x", &x) &&
sscanf(s.substr(10, 8).c_str(), "%x", &y)) {
  bm[(static_cast<unsigned __int64>(l) << 50) + (static_cast<unsigned __int64>(y >> 7) << 25) +
(x >> 7)].push_back((x & 0x7f) + ((y & 0x7f) << 7));
        }
```
with some more readable U++ code you will have it all, and more portable .
