Hello Neil

- About win32dummy
After trying unsuccessfully to compile the package with MSC I realize there was that folder with
include files designed for MSC and windows in general so I just used it. Then MSC compiled well.

- About the library
In Build methods you say the compiler in which folders are the libraries, but in Package organizer
you say the compiler which are the libraries to use.

- About the arg list
It is very easy. Just use CommandLine(). It returns a Vector<String>& with all the args.
