daveremba wrote on Tue, 14 June 2011 05:40Hi Honza,

The linux install to ~/upp worked ok,  
make install

and as you said a build method is needed,  
because the build attempts to link with  
libs that aren't there (like GTK).

Adding NOGTK flag to the build method should help in this particular case (as you already found out when building theide )...

I did encounter one run-time problem so far,  
which is that pull down menus and option menus  
don't work.  
I will investigate this, and there will be  
probably some source code change.

Similar problem was discussed in this thread some time ago... IIRC we didn't find any fully  
satisfying solution, but it should give you the idea where to look.

The instructions are nice and clear, most of it should be easy to solve once and forever by slightly  
modifying the sources and/or makefile generator.

Honza
