complex, maybe in this particular, would not it be a good ideas to use std::complex this time?

Mirek

Hi Mirek,

Std::complex is not a bad implementation. It is versatile, optimized and also has a good support in gdb On the other hand, I'd like to have something more "U++-like". What about wrapper class that would have std::complex as a base and just add functions like ToString, Xmlize etc.?

Honza

Some of them could be done as external function, just like we did it for int/double...

Mirek
