I have used the portable version a couple of month ago to write my first C++ program, if I remember correctly, but still didn't thank you for preparing the package. Sorry for that. So please accept my belated thanks now.

As the external link is dead and as you mentioned to create a Linux/UNIX? version as well and the current U++ release is already old some months so that a new one might appear some day, do you plan to create a new portable package for that one? I'd certainly appreciate that and I think new users especially on Windows also would. A guide to create a portable version on one's own or a word on how to update one would also be very helpful and appreciated.
