Hi all
Does upp have any support for Bluetooth?

I am tryig a sample from MS sdk but I cant understand how to execute it. The same code works for server and cient. When no argument is provided it works as a server, otherwise it works as a client. Code has no debug information to the screen and I added some wprintf to see the details of the server socket in Bluetooth.

When I run the server, with no args, It says:
Local Bluetooth device is 00027219a49e, server channel = 11 (my code)

In other console I run the client like this:
C:\Program Files\Microsoft SDKs\Windows\v7.1\Samples\netds\winsock\bluetooth\Deb
ug>bthcxn.exe -n00027219a49e -c50

It says:

INFO | Inquiring device from cache...

INFO | Unable to find device. Waiting for 15 seconds before re-inquiry...

INFO | Inquiring device ...

INFO | Unable to find device. Waiting for 15 seconds before re-inquiry...

INFO | Inquiring device ...

-FATAL- | Unable to get address of the remote radio having name 00027219a49e

Can someone tell me where can I see the the serverdevice name or the address to provide to client? It seems that 00027219a49e does not works as an address.

Thank you so much

JoseB
