i'll be checking it.. thanks for welcoming hope to help.

current name was RealFb which should probably be set to LinuxFb or sth. like PosixFB?

you are currently using the windows virtual key codes. why not keep them? stdids.h is lend from win32 as well and is part of CtrlCore (for X11) so why not? save some work actually. i admit i havent spend much on this issue anyhow..i just copied the VK codes from WinUser.h to make it run.

did you think about the GUI\_X11 problem and how to solve it?

for best performance , ImageBuffer should be initializable from a given buffer as well. thus we can spare ourselves some copy time..

but it has Buffer<char> pixels inside..maybe to use sth different? maybe it will be difficult because of ref count Image data takeovers.. but think about it.
