Interesting, so my best bet is to just create some sort of validating function to automatically change the single quote to have an escape character in front of it?

Also, I have another question:

What is the syntax for the Update function for the SQL dialect. Here is what I use for Insert (Found it in the example),

```
sql*Insert(DB_NAME)(DB_CUSTNAME, ~supportmodify.edtName);
```

I am not sure how do to the same, but to update a particular record according to the primary key. I am assuming some sort of

```
sql*Update(DB_NAME)(DB_CUSTNAME, ~supportmodify.edtName)Where(DB_TICKET,  
~supportmodify.lblTicket);
```

This example does not work however.

Justin
