Subject: Re: Timestamp accuracy in postgres and upp
Posted by Zbych on Wed, 06 Jul 2011 13:02:12 GMT

I don't want to change TIME definition because of backward compatibility, but it is your decision.

In my application I keep some logs in a database. Once in a while another application transfers those logs from the database to main server and I use timestamp to remember which logs were already transfered.
If the last log has timestamp 17:00:00.5 (timestamp is added automatically by postgres), upp rounds it to 17:00:00. Next time I will search for logs with timestamp >17:00:00 and the log with timestamp 17:00:00.5 will be transfered again. That is why I need the same timestamp resolution in both upp and database.
