I think there ought to be more discussion in the forum
of a general nature, so let me reply in the
this thread instead.

The simple port of
TheIDE is working on MacOSX, and I think that
was the focus of this thread. There are
some problems with the resulting code,
perhaps resulting from not having GTK yet,
or maybe requiring a full port to Cocoa.

The question now is what exactly should it build
on MacOSX? How does that tie into Rainbow, etc?
