nlnelson wrote on Mon, 11 July 2011 07:01 What advantage is there with "LeftPos(..." over "SetRect(..."?

None Actually, in this case I would use SetRect. The *Pos() functions are useful when you want some advanced positioning made easy, imagine that you want to put widget in the bottom, horizontally centered. That would require quite some arithmetic using SetRect, while HCenterPos(width).BotomPos() will calculate it for you. Also, when positioning Ctrl's, these functions are usually a must, because they ensure proper behavior when the window is resized.
